

# TESTING FOR PLATINUM

First remove any protective coating

## TESTING FOR PLATINUM AND WHITE GOLD

Scratch the piece to be tested over the surface of the black stone, press well so as to leave a visible deposit, preferably a line of 1" long.

Transfer a drop of the platinum test solution to the scratch made. (Take into consideration that the background of the test stone is black).

The material on the stone is Platinum, it should keep its white, bright color. Platinum test liquid can also be used for 18K and 14K white gold. In the case of 18K, the material on the stone should start changing to a light bronze color in about 3 minutes.

Also you can test 14K white gold. When you drop the of the Platinum test solution to the scratch made, material on the stone should disappear in about 15 seconds.
